Education

Korea Advanced Institute of Science and Technology (KAIST) Daejeon, Korea

B.S. in Computer Science, School of Computing *Mar. 2022 – Feb. 2028 (Expected)*

- Dean's List (Spring 2022)

Experience

AI Implementation Strategist (Intern) Jun. 2026 – Aug. 2026

Tynapse *Seoul, Korea*

- Red-teamed production LLM-based conversational agents for safety verification, replacing ad-hoc attacks with a goal-based attack taxonomy (system prompt extraction, false policy injection, authority impersonation, jailbreaks, PII leakage) and a categorized attack-case catalog that exposed coverage gaps
- Ran the same attacks across multiple LLMs to separate model-specific from LLM-wide vulnerabilities, and documented bypasses that system-prompt hardening alone could not block
- Redesigned the UI of Red Team Runner, the in-house automated red-teaming tool, with result analysis and live run-monitoring views; extended its attacks to multilingual, multi-turn, and image inputs, deployed v1 company-wide, and demoed it to all staff
- Designed and built agent-core, the core module of an internal verification-support agent, with a database for chat logs and a knowledge base; added image input support

FMWR, USAG Yongsan-Casey Aug. 2024 – Feb. 2026

Korean Augmentation to the United States Army (KATUSA), Eighth Army *Dongducheon, Korea*

- Served mandatory military service as a KATUSA soldier in a cross-cultural, English-speaking unit

Projects

Halt? | *TypeScript, Z3* Fall 2026

- Browser puzzle game about proving that loops terminate, built for KAIST CS424 (Program Reasoning)
- Players decide whether each of 18 loops terminates, then prove it with a ranking function or refute it with an input that runs forever
- Every proof is checked by the Z3 SMT solver running in the browser; playable at halt-seven-delta.vercel.app

Black and White | *F#, .NET* Spring 2026

- Command-line strategy game of deduction and bluffing, built as the term project for KAIST CS220 (Programming Principles)
- Each side plays tiles 0–8 face-down, revealing only their color (even or odd); the player must deduce the computer's hidden hand from colors and round results

Activities

GDGoC KAIST Sep. 2026 – Present

Member, Google Developer Groups on Campus *Daejeon, Korea*
